

MADHAVI KANDULA, M. D.
DERMATOLOGY & COSMETIC DERMATOLOGY

RADIESSE®-WHAT TO EXPECT

- * Radiesse is a dermal filler that is injected into the skin to soften creases or folds, support areas of volume loss or contour specific facial areas.
- * Local numbing medication may be used to maximize your comfort during the procedure. Most patients report a mild discomfort typically associated with needle injections.
- * You may experience a mild to moderate amount of stinging or aching sensation post injection.
- * To ensure an even correction Dr. Kandula will massage the area treated, which may cause a temporary, minimal to moderate amount of redness to your skin.
- * Bruising at the site of injection is a commonly reported side effect. To minimize bruising, inform Dr. Kandula if you use blood thinners such as ibuprofen, aspirin or herbal preparations prior to your procedure.
- * Temporary minimal to moderate swelling can be expected, which should dissipate following injection. Some patients report dramatic reduction in swelling hours after their treatment.
- * It is normal to experience some tenderness at the treatment site for a few days.
